THE FOURTH INDUSTRIAL REVOLUTION AND THE CHANGE OF THE POLITICAL ATTITUDE OF YOUTH

***Abstract:** the development of globalization will be linked to the world, the development of the industrialization of the world to integrate together, convenient transportation and developed the Internet will be unified together in the world. The development of industrialization to the primary industry with labor and cost in the world, when the United States and Europe as the "brain" of countries, the transfer of manufacturing, and focus on the fourth industrial revolution does not need too much labor, the employment crisis will spread in the traditional manufacturing industry, triggering a populist political attitude and social youth a lot of dissatisfaction and, this is the most direct impact of changes in the fourth industrial revolution to the political attitude of the youth.*

***Key words:** the fourth industrial revolution; young people's political attitude; manufacturing industry.*

Introduction. In human society, every technological change will lead to social change, which will lead to the change of career and social class. 2016 world economic forum released forecast, the fourth industrial revolution will change the business model and the labor market in the next 5 years, to create 2 million 100 thousand new jobs, 7 million 100 thousand jobs will disappear. New formats, new business models, new business models and new economic components represented by the new round of technological revolution, are triggering new social changes.

The emergence of new jobs and inter regional, inter industry aggregation, changes in the class, the cause of the new employment flows, while the youth as a high-end labor force is the main cause of technological change in the flow of employment.

1. Industrial revolution and employment. Application of general linear regression on the 100 big American City graduates of the average family income, unemployment rate, employment rate and laid the foundation for the study of regional flow analysis on regional outflows and inflows of graduates¹. Manufacturing output,

change and accumulation have a huge impact on the flow of youth employment.² The emergence of the new sector, led to the main labor market and the secondary labor market, the employment of different talents demand. Technological revolution led to the gathering of young people in the new industry³. The economic fluctuation caused by the new economic department and the relationship between the economic fluctuation and the Regional Employment Fluctuation⁴. With the individual characteristics of the graduates and the characteristics of the area as the independent variables to carry on the regression analysis, put forward the "characteristics of the employment flow"⁵ Technological innovation has a more important role in the growth and work flow of the labor force.⁶ New industry derived from the employment fluctuations triggered by regional development, accelerate the flow of young people to the new production sector. By establishing the regression equation between the human capital inflow and the area knowledge assets, the relationship between the enrichment of knowledge assets and the inflow of employment in the area is detected.⁷

The study, from the third industrial revolution after the perspective of technological innovation, analyzes the impact of technology caused by human capital, regional characteristics and new industries, the new Department of youth area and inter industry mobility between jobs, but the industry and the region between the horizontal flow of employment, to study the vertical flow change career status as the representative the relatively small, and the objective analysis of the influencing factors, active participation of youth employment flow, adapt to the relatively less systematic theory construction and empirical research of technological change environment.

2. Discovery of Chinese scholars. The relationship between occupational and social stratum's surface flow structure caused by technological change⁸ Under the multiple segmentation of labor market in China, the technological revolution is different in the different development degree of the labor market, which causes the gradient of the youth employment mobility.⁹ The information industry has led to the replacement of the flow, which makes the frequency of social mobility to speed up and increase the

vitality of the community, young people are the main force of participation"¹⁰

And human capital is the decisive factor that affects the employment of college graduates in the new department.¹¹High end third industry is not developed leading to be able to absorb as knowledge or technical type of human capital (Youth) the ability to decline¹²The study analyzes the influence of different factors on technological change caused by the employment of the youth movement, some related to the change of class and occupation flow, but the industry has caused the change of the youth based on technology between regions, employment flow system and overall research is still relatively small, there is also lack of empirical research or survey only in the country a region of vertical flow, vertical flow of national youth employment empirical research is relatively small, but China's active participation in youth employment flows, adapt to the relatively less systematic theory and empirical research on technology innovation environment.

3. New achievements of the fourth industrial revolution. Foreign research trends, the emergence of the new format sector, the high-end talent aggregation and demand is different from the previous industrial revolution subversive changes, the talent gathering to the high-end.

Industry 4 era of mankind will usher in a high degree of production of digital, networking, machine self-organization as the symbol of the fourth industrial revolution, the depth and breadth of ginseng and employment mobility will be based on the premise of innovation capacity¹³The fourth industrial revolution triggered by the new industrial revolution caused by the erosion of traditional industries jobs, new formats bring new employment opportunities, young people are faced with the employment crisis, the dual choice of employment opportunities¹⁴

At the same time issued by the British independent communications and marketing consulting company in Australia, Brazil, Britain, France, Germany, China, India, the United States and South Africa, survey of nearly 9000 people aged 16 to 25 year old youth, nearly 80% of respondents said that technological progress speed is too fast, so we must continue to learn no professor in the school of new knowledge.

The conclusions. The emergence of new formats produced a qualitative impact on these industries mainly in the employment of youth in the world and China appeared obvious changes, but the youth employment flow of new formats environment about the fourth industrial revolution caused by the domestic and foreign research, mostly focused on the fact that describe or predict the flow effect on employment the new format environment of youth, youth employment in the new state in the flow path is lack of systematic and comprehensive empirical research and theory construction.
